

Discussion of FizzBuzz worksheet

(Christensen – August 22, 2016)

Parameters or criteria for “better” might be:

-
- 1) Execution time
 - 2) Memory use
 - 3) Time to develop
 - 4) Skill level needed to develop
 - 5) Skill level and time to debug
 - 6) Ability to be extended
- Classical views of scalability
- Code reuse play a major role here
- Development cost
- Let's say “FizzBuzzBoom” where “Boom” is printed if divisible by 7.

- We have notions of “elegance” and that less code is better than more code.
 - These notions may (or may not!) make sense.
- So, which FizzBuzz version is better of each of the above criteria?
